

# Lightning Guardian®

Lightning Protected Golf Shelters

The Lightning Guardian® is the first gazebo pre-engineered to fully integrate a certified lightning protection system, which is designed specifically for use on golf courses.

**The Lightning Guardian is the first gazebo pre-engineered to fully integrate a certified lightning protection system, which is designed specifically for use on golf courses.**

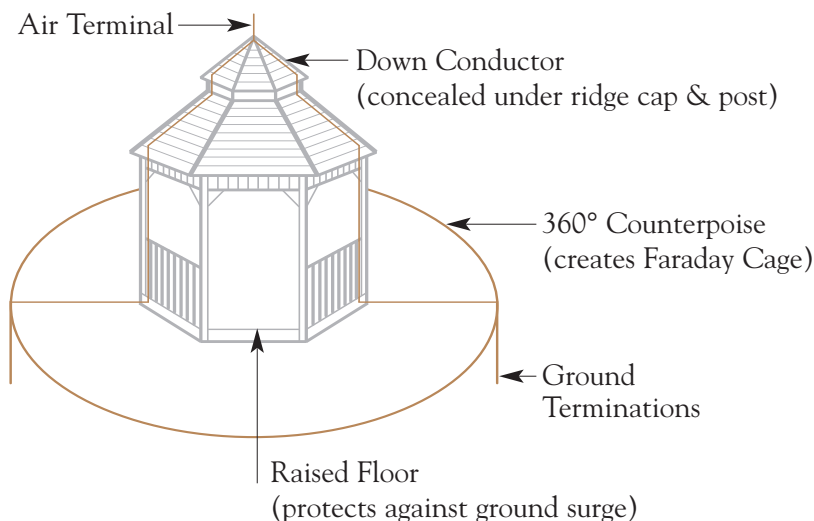

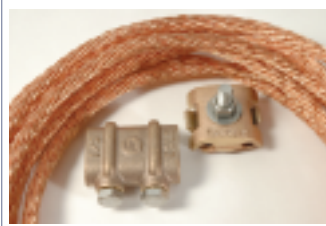

The Lightning Guardian is the solution to outpost lightning-protected shelters. We have combined the beauty and elegance of our White Cedar Gazebos with a lightning protection system, which can be UL Certified. Our product is the result of two years of development and a cooperative effort with experts in the areas of lightning protection and golf course safety.

The Lightning Guardian's protection systems are designed to provide protection for the shelter and its occupants from both the effects of direct and indirect lightning strikes. We have taken into consideration several potential and common lightning hazards such as touch potential, ground surge, side flash and direct lightning strikes. We have put together the highest level of lightning protection available, which complies with the strict installation requirements of Underwriters Laboratories, the National Fire Protection Association and the Lightning Protection Institute. The Lightning Guardian is eligible for an independent and site specific UL Master Label Certification.

Properly installing an adequate number of Lightning Guardian golf shelters in remote areas of your course will demonstrate your facility's commitment to the safety of its members, employees and visitors.

**UL listed and National Fire Protection Association (NFPA) compliant lightning components.**

## Lightning Facts

**1** Seeking safety in a certified lightning shelter when there is potential for lightning in the immediate area, is highly recommended by insurance companies, educational institutions, the golfing community itself as well as safety organizations such as NFPA, UL and LPI.

**2** Distance to safety is key when a storm arises. Placing shelters within safe reach of golfers who are walking as well as riding will minimize the risk of injury.

**3** Not only is a direct lightning strike deadly but lightning can also be lethal by traveling below and along the surface of the ground. Certified lightning shelters should have a raised non-conductive floor to protect against indirect lightning strikes.

**4** Lightning fatalities receive most of the attention but in fact approximately 70% of survivors will sustain long-term medical expenses due to memory deficits, numbness, sleep disturbances, confusion or overall loss of strength.
